(~~12.~~ (currently amended) A multilayer composite structure, comprising:

- a. a first foam layer comprising polyethylene homopolymer or copolymer;
- b. a second foam layer comprising polypropylene homopolymer or copolymer; and
- c. a coating disposed between and bonding said first and second foam layers together at a bond strength of at least about 4 lb_f/inch, said coating having a thickness ranging from about 1 to about 6 mils and comprising at least one member selected from the group consisting of ethylene/propylene rubber, homogeneous ethylene/alpha-olefin copolymer, and ethylene/acrylic acid copolymer, wherein
said polyethylene foam layer has a thickness ranging from about 1/16 to about 1 inch and said polypropylene foam has a thickness ranging from about 1 to about 4 inches, and
said composite structure is in the form of a flotation article.

2
13. (previously presented) The composite structure of claim 12, wherein said coating comprises ethylene/propylene rubber.

3
14. (previously presented) The composite structure of claim 12, wherein said coating is substantially solventless.

4
15. (previously presented) The composite structure of claim 12, wherein said first foam layer comprises low density polyethylene.

5
16. (previously presented) The composite structure of claim 12, wherein said first foam layer has a density ranging from about 0.4 to about 15 pounds/ft³.

6 17. (previously presented) The composite structure of claim 12, wherein
said second foam layer comprises polypropylene homopolymer.

7 18. (previously presented) The composite structure of claim 12, wherein
said second foam layer has a density ranging from about 0.5 to about 10
pounds/ft³.

8 19. (previously presented) The composite structure of claim 12, wherein
the bond strength between said first and second foam layers is at least
about 4.5 lb_f/inch.
